CYBER RISK: WHAT’S AT STAKE FOR YOUR BUSINESS?
Dan has over 30 years of experience in public accounting and specializes in the performance of forensic accounting and litigation support procedures, SOC examinations, internal accounting controls assessments and information technology consulting services.
CYBER RISK: WHAT’S AT STAKE FOR YOUR BUSINESS?
AGENDA

- CURRENT ENVIRONMENT
- CYBER RISK: CORPORATE GOVERNANCE IMPLICATIONS
- CYBER SECURITY: IMPLEMENTATION PROGRAM
- CYBER SECURITY: BEST PRACTICES – ESSENTIAL CONTROLS
CURRENT ENVIRONMENT
62% of all cyber attacks (approximately 4,000 per day) occur in small to mid-size businesses

60% of small businesses that experience a cyber attack are out of business in 6 months

The average price for small businesses to clean up after a “hack” is $690,000
The average time to identify that an event has occurred is 6 months with an average time of 2 months to contain the incident.

75% of companies breached learn from an outside party.
PROMINENT CYBER ATTACK TYPES

1. PHISHING
2. CREDENTIALS
3. RANSOMWARE
Phishing

A form of social engineering in which a message, typically an email, with a malicious attachment is sent to a victim with the intent of tricking the recipient to open an attachment.

13% of people are estimated to click on attachments.
CURRENT ENVIRONMENT

2 Credentials

Use of stolen information such as usernames and passwords. Standard mode of operation for organized criminal groups and state-affiliated attackers.

63% of confirmed data breaches involved weak, default or stolen passwords.
A form of malware that encrypts files resident on the infected device and, in worst cases, attached file shares. Extortion demands follow.
Small to mid size business threats are real – not just the province of large corporations

Various types of cyber attacks – phishing and ransomware are currently the attack de jour

Credentials – we all need to do a better job of protecting our credentials (usernames and passwords); as well as not publicizing potentially exploitable information on social media
CYBER RISK: CORPORATE GOVERNANCE IMPLICATIONS
• Cyber Security is no longer chiefly the domain of CIOs, CISOs and IT Departments.

• Regulators (or interested third parties) increasingly expect that Board Members and Senior Managers have a sufficient grasp of cyber security core principles.
Threat is escalating (mobile devices, social media and the Internet of Things (IoT)).

Directors should ask questions about the types of scenarios that the company should plan for.
80% of Directors discuss cyber security at most meetings but 66% lack confidence in their company’s ability to protect itself.
41% The biggest fear of 41% of Directors is brand damage due to loss of customers.

OTHER FEARS:
• cost of responding to breaches
• loss of competitive advantage
• regulatory and compliance violations
Cyber Defense should incorporate these five themes.
Not just an IT issue

Senior Management needs to take an active role

Unavoidable – Regulators and Interested 3rd parties are mandating policies and procedures to protect
CYBER SECURITY: IMPLEMENTATION PROGRAM
1. Conduct a Risk Assessment
2. Build an Incident Response Team (“IRT”)
3. Share Information
4. Test the Incident Response Plan
5. Satisfy Legal Obligations
CYBER SECURITY: IMPLEMENTATION PROGRAM

Risk Assessment

NIST Framework has 5 elements ("functions")

- Identify
- Protect
- Detect
- Respond
- Recover

KLR
Risk Assessment

- Inventory of Systems
- Risk Assessment
- Implement measures to eliminate/mitigate risks
- Implement measures to detect potential incidents
Build an IRT

- Comprised of All Key Stakeholders (internal/external)
- Define Incident Scenarios
- Build an Incident Response Plan ("IRP")
CYBER SECURITY: IMPLEMENTATION PROGRAM

3. Share Information

- Subscribe/Get Involved in Industry Groups
- Stay current on latest threats
- Modify Risk Assessment and IRP as appropriate
- Remediation
4 Test the IRP

• Should be done at least annually
• Build realistic scenarios based upon Risk Assessment
• Conduct test
• Conduct Post-Mortem (“lessons learned”)
• Modify IRP and Risk Assessment as appropriate
Satisfy Legal Obligations

- Know the laws at the federal, state and local jurisdiction relevant to you
- Consider cyber insurance
CYBER SECURITY: BEST PRACTICES
1. Establish Technical Controls based upon the following Security Framework:
   - Enterprise Security
   - Endpoint Security
   - Data Security
   - Monitoring and Testing
   - Security Review and Evaluation

2. Controls should be established after the Risk Assessment
CYBER SECURITY: BEST PRACTICES

- Firewalls
- Intrusion Detection/Intrusion Prevention
- Network Segmentation
- DMZ
- Multi-Factor Authentication into the environment
CYBER SECURITY: BEST PRACTICES

- Antivirus/Anti-Malware
- Patch Management
- Data Loss Prevention ("DLP")
- Encryption
- Mobile Device Management ("MDM")
CYBER SECURITY: BEST PRACTICES

- Access Controls
- Encryption
- File Access Monitor (“FAM”)
- Segmentation
CYBER SECURITY: BEST PRACTICES

Monitoring and Testing

- Vulnerability and Penetration Testing
- Security Information and Event Management ("SIEM")
- Internal Scans
Security Review & Evaluation

- Quarterly Access Review
- Social Engineering Testing
- 3rd Party Examinations/Audits
CYBER SECURITY: BEST PRACTICES

- Continuous **USER EDUCATION**
- Security Awareness Training
- Robust Policies and Procedures with annual user attestation
- Limit Removable Media
- Limit Remote Access
- Password vs Passphrase policies
- Administrative Privilege Control
KEY TAKEAWAYS

- Not an IT issue – it’s an Enterprise Issue
- Not “If” but “When”
- Start your Risk Assessment Today
- Understand what you are trying to protect
- Implement technical controls based upon the Risk Assessment
- Training, Training, Training
